

### *Succulent Wreath Care*

**LIGHT:** Succulents prefer some protection from midday sun if kept outside. A south facing window is ideal if kept indoors.

**WATER:** Soak wreath once every 3 to 10 weeks depending on plant needs. Water is needed when the planter feels lightweight, or the leaves have puckered. Do not mist/spray plants as this practice encourages shallow roots and weak plants. Deep soaking and allowing soil to dry out completely between watering works best.

**FERTILIZING:** Little fertilizer is needed. In the spring and summer a feeding of liquid fertilizer or seaweed can be added to the soaking water.

**PRUNING:** Succulents grow slowly, to maintain shape, pinch or prune back. Cuttings can be planted into a pot once callused.
